

Abstract

This original synthetic abstract tests deterministic import, complete evidence, stable ordering, and explicit handling of every record.

1 Evidence Model

Each frozen record has one disposition, one stable source pointer, and enough synthetic prose for an independent native-text oracle to classify this page safely.

Definition 1. A stable record has exactly one source pointer.

Theorem 1. Frozen inputs produce deterministic identities.

Proof. The identifier seed uses only frozen hashes and pointers.

Example 1. Repeating an import yields the same ordered IR.

$E = m c^2$

Figure 1. A synthetic evidence flow.

All values are illustrative.

Chart 1. Deterministic counts.

The chart reuses the original synthetic asset.

Table 1. Synthetic gate inventory.

HTML is preserved as structured source.

```
def stable(value):  
    return value
```

Listing 1. Stable identity.

The code body must appear once.

1: read frozen records

2: emit one disposition

Algorithm 1. Explicit accounting.
